SUMMARY

B.Tech Artificial Intelligence and Data Science student with production software experience across backend services, LLM systems, RAG, MCP-based agents, and applied AI research. Built knowledge-graph retrieval systems, multimodal deep-learning pipelines, and production Go/Python services.

EDUCATION

Amrita Vishwa Vidyapeetham <i>B.Tech in Artificial Intelligence and Data Science, CGPA 7.62</i>	Amritapuri, Kerala Aug 2024 – Expected 2028
Sasi E.M High School <i>Higher Secondary (CBSE) 84% / Secondary (SSC) 95%</i>	Andhra Pradesh

EXPERIENCE

Heapvue <i>Associate Software Developer II</i> <i>Associate Software Developer</i> - Built VueCart, an e-commerce product, from scratch using Next.js, Go, and PostgreSQL on DigitalOcean. - Developed MCP-based AI agent systems involving RAG and multi-agent workflows, including the Chatpress chatbot backend built on Go microservices. - Built an Unanswered Query Classifier using fastembed-go and DBSCAN and shipped production LLM systems through Docker and REST APIs.	Kochi, India (Remote) Feb 2026 – Present Aug 2025 – Feb 2026
Lacones Labs: CCMB Collaboration <i>AI Research Intern</i> - Built an underground biosignal monitoring system using piezoelectric, acoustic, and accelerometer sensors with Butterworth filtering, STFT, CWT, and MFCC-based signal processing. - Used CNN, BiLSTM, attention-based sensor fusion, and LSTM autoencoder models for biological-activity classification.	Hyderabad, India May 2026 – Aug 2026

PROJECTS

Agri-CoEvoKG-Agent Built a temporal agricultural knowledge graph with Neo4j and Qdrant, combining graph retrieval with Gemini/Groq and hybrid BM25+dense search. Achieved 96% accuracy on 564 held-out questions, compared with 85–86% for dense RAG and 63–69% for BM25.	2026
DhanDost Built an agentic personal-finance assistant using Amazon Bedrock AgentCore and MCP, with bank-statement parsing, spending insights, AWS Lambda/Chalice backend, Cognito authentication, and a React/TypeScript frontend.	(Devhacks 7.0 finalist) 2026
CausalHydroNet: Underwater Image Degradation Modeling Developed a causal underwater-vision model that separates scene semantics from water/physics latents using a Jaffe-McGlamery differentiable degradation model, SegFormer-B2 encoder, latent splitting, and a prototype-based segmentation head.	2026

SKILLS

Programming: DSA, OOPS, Python, Go, R, TypeScript, Java, SQL, C#
AI/ML: Deep Learning, PyTorch, LangChain, RAG, MCP, Agentic AI, LangGraph, Agno, Scikit-Learn
Data/Infra: Neo4j, Qdrant, Docker, REST APIs, FastAPI, AWS, Kubernetes

ACHIEVEMENTS

- The Adaptation–Embodied Carbon Paradox:** first-authored paper accepted at the **ACM AI Summit 2026**, Visionary Track. Proposed a continual-learning approach for wear-limited edge hardware that reduced simulated NVM writes by 7–25× while keeping accuracy within 0.5–1.5 points of six baselines.
- Finalist:** Devhacks 7.0, IIT Dharwad (DhanDost), and AI Hackathon, AP RTGS (AI-Based Granite Block Measurement and Automated Seigniorage Assessment).

LEADERSHIP

SIG-AI, ACM Student Chapter <i>Lead</i> <i>Co-Lead</i> Led multi-technical bootcamps covering Deep Learning, MCP, MoE, Quantization, RLHF, and deployment; organized AI workshops and hackathons and mentored peers.	May 2026 – July 2026 Jun 2025 – May 2026
